

AI Prompt for Nano Bana for Architecture Model 27

Create a hyper-realistic cinematic render using the uploaded human image (converted to male) and the uploaded building image. The male human must remain natural and realistic — identical facial details, hairstyle, expression, and body posture — with no distortions. Show him working with focus, carefully interacting with the uploaded building represented as a 1:7 scale architectural model on the desk.

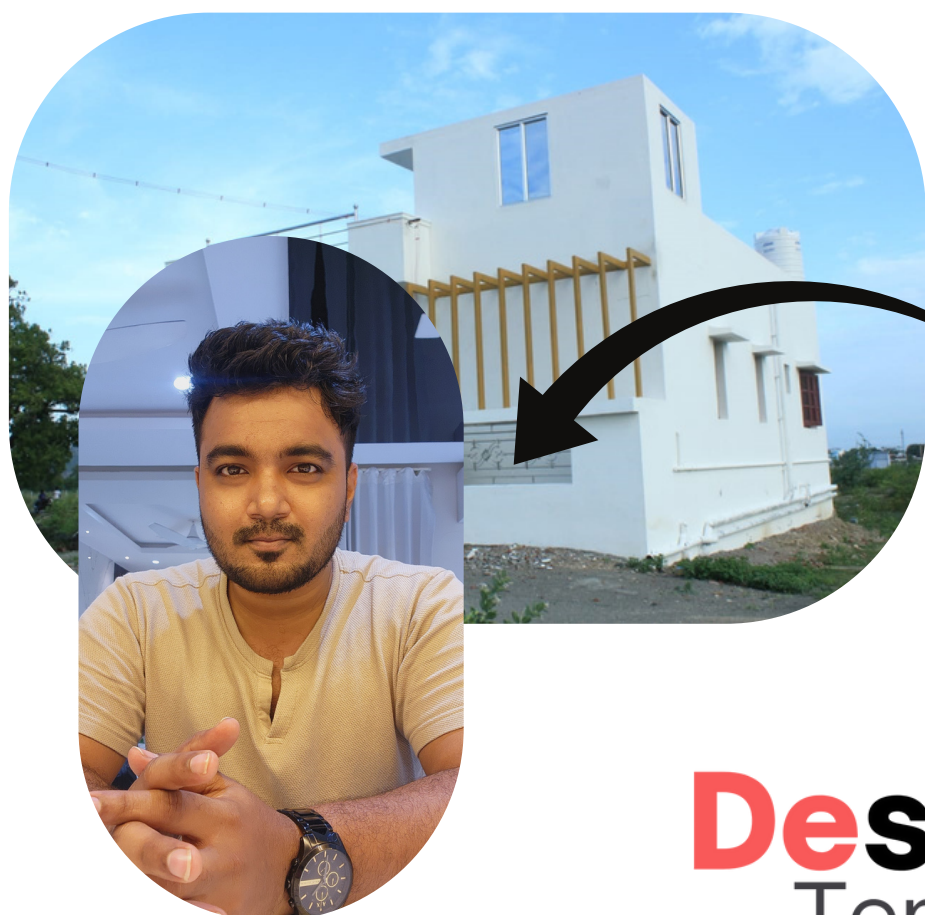

Keep the camera angle closer than the reference, capturing a tight side-profile shot with the male subject and the building model in sharp focus. The architectural model should be highly detailed, illuminated by warm desk lighting with glowing windows, miniature trees, and pathways for added realism.

In the background, include several other architectural models placed on shelves and tables, but keep them blurred with depth-of-field effect, ensuring they add context without distracting from the main subject.

Maintain cinematic lighting: warm golden tones from the desk lamp illuminating the model, soft highlights on the male subject's face and hands, and a gentle ambient studio glow.

Apply color gradients and atmospheric depth to replicate the design studio environment with a moody yet professional finish.
